

# ACCESS-OM2: The Consortium of Ocean-Sea Ice Modelling in Australia's global ocean and sea ice model

Andrew Kiss, Andy Hogg, Kial Stewart, Adele Morrison, Aidan Heerdegen (ANU);

Nicholas Hannah (Double Precision); Paul Spence, Matthew England (UNSW);

Russell Fiedler, Simon Marsland, Peter Oke, Siobhan O'Farrell (CSIRO);

Maxim Nikurashin, Fabio Dias (UTas); Petra Heil (AAD & ACE CRC, UTas);

Gary Brassington, Helen Beggs, Justin Freeman (BoM); Fanghua Wu (Beijing Climate Center);

Stephen Griffies (GFDL); James Munroe (Memorial U. Newfoundland)

**TODO: consolidate author list and add anyone who's missing (order is arbitrary at this stage)**

The latest version of this document is available from

GitHub: <https://github.com/aekiss/ACCESS-OM2-1-025-010deg-report>

and Overleaf: <https://www.overleaf.com/11449164wmwcrxynvgpx> (to use Overleaf with git, see

<https://www.overleaf.com/blog/195-new-collaborate-online-and-offline-with-overleaf-and-git-beta>; note that this feature may be shut down

in the 4th quarter of 2018: <https://www.overleaf.com/help/343>).

This version: typeset 2018-05-30 21:16:13 +10:00

Set 'gitinfo' boolean to 'true' in preamble to show git version information (doesn't work in Overleaf; you may also need to run RUNME.sh).

## CONTRIBUTORS PLEASE NOTE:

- please sign up with GitHub and click “watch” on <https://github.com/aekiss/ACCESS-OM2-1-025-010deg-report> to be kept informed of discussions
- to discuss aspects of the paper, please post an issue at <https://github.com/aekiss/ACCESS-OM2-1-025-010deg-report/issues> instead of using email
- to make git diffs easier, please try to write each sentence in the .tex file on a separate line
- add “to do” items to the .tex file with `\TODO{...}`
- note errors and problems with `\FIXME{...}` in the .tex file
- PDF is preferred for figures (especially line plots), otherwise PNG but not JPG. We would like all figures to be generated by a Jupyter notebook in the “notebooks” directory to facilitate editing and updating. Each notebook should be in a separate subdirectory, and all its output figures should be saved in that subdirectory so we can easily tell which script generated each plot. For latex compatibility, don't use spaces in your Jupyter notebook filename, directory name, or output image filenames. You'll also need to download the COSIMA Cookbook from <https://github.com/OceansAus/cosima-cookbook>. See <https://github.com/aekiss/cosima-cookbook> for how to get git diff to work nicely with Jupyter notebooks.
- use a bare number (no leading v) if you do git tags (for compatibility with the gitinfo2 package used here)

## List of Figures

Model	$n$	$\Delta z_{\min}$ (m)	$\Delta z_{\max}$ (m)	$H_{\max}$ (m)
ACCESS-OM2	50	10.0	334.7	6000.0
ACCESS-OM2-025	50	10.1	209.9	5500.0
ACCESS-OM2-01	75	1.1	198.4	5808.7

**Table 2:** Vertical grid parameters:  $n$  levels, with spacing of  $\Delta z_{\min}$  and  $\Delta z_{\max}$  at the surface and maximum depth  $H_{\max}$ , respectively. **TODO:** these are discretised values from ocean\_vgrid.nc - check that I'm correctly using the notation in Stewart et al. (2017)

## 1 Purpose of this document

This document serves two purposes:

1. This is a technical report to document the configuration and performance of the ACCESS-OM2 suite of models at 1, 0.25 and 0.1° horizontal resolution (<http://cosima.org.au/index.php/models/>), intended to be a resource for the user community (e.g. COSIMA) and readily updated. This approach was partly inspired by Griffies (2015).
2. This will form the basis of one or more journal papers to announce and assess the performance of these models, most likely to be submitted to GMD <https://www.geoscientific-model-development.net>

**TODO:** copy things from ARCCSS workshop poster, AMOS2018 talk, Bluelink talk, COSIMA workshop

## 2 Introduction

This technical report documents the ACCESS-OM2 ocean-sea ice model at nominal horizontal resolutions of 1°, 0.25° and 0.1°.

## 3 Model Configuration

### 3.1 Overview

MOM, CICE, OASIS, JRA55

### 3.2 MOM configuration

MOM parameters for the three model resolutions are tabulated in Appendix A.1. We discuss the choices of key parameters here.

**TODO:** cannibalise NCMAS application

#### 3.2.1 Vertical grid

See table 2.

Discuss KDS vertical grid Stewart et al. (2017)

**TODO:** update? Kial is setting up KDS50 at 1°

discuss partial cells

ACCESS-OM2 uses GFDL50 **FIXME: wrong? doesn't match GFDL50 in table 1 of Stewart et al. (2017)** 50 levels, 10.0m spacing in top 200m then increasing smoothly to 334.7m by the bottom at 6000m.

ACCESS-OM2-025 uses KDS50 **FIXME: wrong? doesn't match KDS50 in table 1 of Stewart et al. (2017)** 50 levels, 10.1m spacing at surface, increasing smoothly to 209.9m by the bottom at 5500m.

ACCESS-OM2-01: KDS75 **TODO: check: maximum spacing and depth slightly different from KDS75** 75 levels, 1.1m spacing at surface, increasing smoothly to 198.4m by the bottom at 5808.7m.

**TODO:** figure showing grid spacing vs depth for ACCESS\_OM2 models and others for comparison

### 3.2.2 Horizontal grid

The grid covers the global ocean, extending from the north pole to 81°S. The grid is Mercator between 65°N – 65°S, and tripolar (Murray, 1996) north of 65°N, with tripoles placed on land at 65°N and -100°E, 80°E. **TODO: describe spacing south of 65S**

**TODO: explain grid refinement at equator – 1° only?**

**TODO: plots of x and y grid spacing in the three models**

[https://github.com/mom-ocean/MOM5/blob/master/doc/web/user\\_guide.md](https://github.com/mom-ocean/MOM5/blob/master/doc/web/user_guide.md): “The grid\_spec file [/short/v45/aek156/access-om2/control/01deg\_jra55\_ryf] contains the following horizontal grid information: geographic location of T, E, C and N-cell (Tracer, East, Corner, and North cells), half and full cell lengths (in meters), rotation information between logical (i.e., grid oriented) and geographic east of cell. The complete description of the horizontal grid and namelist option is available in hgrid”

### 3.2.3 Bathymetry

There are no ice cavities as these are not supported in MOM5.1. Topography ends at a vertical wall at the ice shelf edge (the calving line, not the grounding line).

#### 1° and 0.25°

0.1° based on Gebco2014 30sec gridded data **FIXME: which version?** [http://www.gebco.net/data\\_and\\_products/gridded\\_bathymetry\\_data/gebco\\_30\\_second\\_grid/](http://www.gebco.net/data_and_products/gridded_bathymetry_data/gebco_30_second_grid/) The topo data used in the runs is /short/v45/aek156/access-om2/input/mom\_01deg/topog.nc

**TODO: check if this relevant to the bathy file we use:** “Enforced minimum of 7 levels (approx 10m). Excavated not filled in so land mask kept. Partial cells: Enforced thickness of max(10,0.2\*dz). If partial cell were thinner than half this then the cell was removed.” ( /g/data3/hh5/tmp/cosima/bathymetry/README )

Minimum depth = 10m

Partial cells: `ncdump -h /short/v45/aek156/access-om2/input/mom_01deg/topog.nc` yields `depth:minimum`  
`depth = 10.43281f ; depth:minimum_levels = 7 ; depth:min_thick = 10.f ; depth:min_frac = 0.2f ;`

### 3.2.4 Other model settings

SGS parameterisations, mixed layer, bottom boundary layer, etc  
horizontal and vertical friction, lateral boundary conditions  
equation of state

## 3.3 CICE sea ice model configuration

CICE parameters for the three model resolutions are tabulated in Appendix A.2. We discuss the choices of key parameters here.

CICE parameter sensitivities: Urrego-Blanco et al. (2016)

### 3.3.1 Thickness redistribution

4 ice layers + 1 snow

5 thickness categories. We use `kcatbound=0`, so lower bound of ice categories is 0, 0.64, 1.39, 2.47, 4.57m (Hunke et al., 2015, table 2). For ridging we use `krdg_partic=1`.

### 3.3.2 Dynamics

**TODO: check I (AK) haven't misunderstood anything here – this is based on only a quick skim of most of these papers**

We are currently using “classic EVP” (`kdyn = 1`, `revised_evp = .false.`) (Hunke, 2001; Hunke and Dukowicz, 1997, 2002). This represents the ice by a viscoplastic (VP) rheology, to which a fictitious elastic term is added to facilitate efficient numerical convergence to the viscoplastic solution via damped

elastic waves which are supposed to decay to negligible amplitude during ndte sub-timesteps within each dynamic timestep (Hunke et al., 2015, sections 3.5.2 and 4.4). Another CICE option is the “revised EVP” method (Bouillon et al., 2013; Hunke et al., 2015, section 3.5.3) which corrects an error in the “classic EVP” stress formulation and may also improve the convergence rate of the elastic sub-timesteps and reduce the incidence of spurious grid-aligned linear kinematic features (“leads”). **TODO: try this out?** Bouillon et al. (2013) argue that this is superior to using “classic EVP”, but see warnings by Kimmritz et al. (2015, 2017) that numerical instability may dominate over convergence as the greatest source of error. **FIXME: wrong references? they don't say this as far as I can see.**

There is an ongoing debate regarding the suitability of viscoplastic ice rheology, particularly to represent on fine scales (Dansereau et al., 2016; Girard et al., 2009; Hutter et al., 2018; Kwok et al., 2008; Lindsay et al., 2003; Nye, 1973; Weiss et al., 2007). An alternative supported by CICE is the elastic-anisotropic-plastic (EAP) model (Tsamados et al., 2013; Weiss and Schulson, 2009; Wilchinsky and Feltham, 2006), but this seems relatively untested and uncalibrated at this stage.

If we accept the VP formulation, there is also the question of how well the EVP sub-timestepping converges to the VP solution with no residual elastic wave effects. Like many comparable models we use ndte=120 sub-timestep iterations, but Kimmritz et al. (2015, 2017); Lemieux et al. (2012); Losch and Danilov (2012) show that full convergence may take thousands of iterations even with the revised EVP method (particularly at high resolution), which would be prohibitively expensive. We must therefore expect our sea ice stress distribution to contain artefacts due to residual elastic waves. These artefacts may include spurious grid-scale noise and long linear features in the shear and divergence fields (Lemieux et al., 2012).

see Lemieux and Tremblay (2009)

discuss linear kinematic features (leads): Hutchings et al. (2005); Losch et al. (2014); Wang and Wang (2009); Wang et al. (2016a)

turning angle is set to zero — is this reasonable? see Leppäranta (2011); McPhee (2008); Park and Stewart (2016) — we are using 10m ageostrophic winds and can resolve the ocean Ekman layer.

Ice-ocean drag coefficient: we use dragio=0.00536; compare to values others have used: Lu et al. (2011).

### 3.3.3 Thermodynamics

mushy ice: Turner et al. (2013)

melt ponds?

## 3.4 OASIS

OASIS3-MCT or OASIS-MCT2?

Nic's work on ESMF regridding

Regridding method - <https://github.com/OceansAus/access-om2/wiki/Creating-Remapping-Weights>

Should we use high-frequency coupling? CICE flag highfreq implements the RASM coupling method of Roberts et al. (2015); also see [http://www.oc.nps.edu/NAME/RASM\\_overview.pdf](http://www.oc.nps.edu/NAME/RASM_overview.pdf)

## 3.5 Forcing

JRA55-do v1.3 atmospheric forcing (1984-5, 1990-1 or 2003-4 repeat-year, 0.5625°, 3-hourly) in addition to CORE NYF (2°, 6-hourly)

### 3.5.1 JRA55-do and repeat-year forcing

JRA55-do user manual: Tsujino et al. (2018b)

Data available from [https://esgf-node.llnl.gov/search/input4mips/?institution\\_id=MRI](https://esgf-node.llnl.gov/search/input4mips/?institution_id=MRI) and on NCI at /g/data1/ua8/JRA55-do/RYP/v1-3/\*.nc

For the latest information on the dataset status and citation: <http://goo.gl/r8up31>.

see [http://amaterasu.ees.hokudai.ac.jp/~tsujino/JRA55-do-v1.3/00README\\_v1.3.1st](http://amaterasu.ees.hokudai.ac.jp/~tsujino/JRA55-do-v1.3/00README_v1.3.1st) JRA-55: Kobayashi et al. (2015) JRA55-do: Tsujino (2015a,b, 2016); Tsujino et al. (2018a), Tsujino et al. (2016)  
<http://www.clivar.org/omdp/japan2016>

JRA55-do version 1.3 provides 3-hourly liquid and solid precipitation, downwelling surface long-wave and shortwave radiation, sea level pressure, 10m wind velocity, specific humidity and air temperature on a TL319 grid, 0.5625° (9/16°) resolution, and daily river flux at 0.25° resolution.

**TODO: check: what do we use for glacier runoff? groundwater? evaporation? upwelling longwave radiation?**

“Runoff from Greenland and Antarctica are replaced by climatological runoff. Greenland runoff is based on Bamber et al. (2012) and Antarctica runoff is based on Depoorter et al. (2013).” ([http://amaterasu.ees.hokudai.ac.jp/~tsujino/JRA55-do-v1.3/00README\\_v1.3.1st](http://amaterasu.ees.hokudai.ac.jp/~tsujino/JRA55-do-v1.3/00README_v1.3.1st))

cf. runoff used in ACCESS-CM2 - see AMOS2018 notes on Dave Bi’s talk

should we / do we use this for runoff? Suzuki et al. (2017)

currently fresh water is input at the ice shelf edges.

Runoff - incl distributed iceberg melt? Ask Adele? basal melt needs to be at depth - notebook p561. We have the data but waiting on it being published. Veronique has regridded this - see email 2017-11-16 Merino et al. (2016) and Depoorter et al. (2013) Paul: “The Antarctic ice berg data is published and the data is publicly available here: <http://neichin.github.io/personalweb/publications/> However, the Antarctic basal melt fluxes are not published yet and the data has not been made public.” Also see Donat-Magnin et al. (2017); Mathiot et al. (2017); Merino et al. (2018)

Runoff - what range of depths is used? Top 4 levels??

discuss choice of year for RYF — will use 1984-5 for high-res runs – refer to Kial’s paper

These 12-month periods were identified as particularly “neutral”: 1 May 1984 - 30 April 1985, 1 May 1990 - 30 April 1991, 1 May 2003 - 29 April 2004 (we keep 29 Feb 2004 and ditch 30 April 2004 so as to keep 365 days per year). We have run ocean-sea ice spinups forced by all three JRA55-do v1.3 repeat years at 1° but we are concentrating on 1984-5 for the 1/10° spinup as it has less of the warming signal and also gives us more of the JRA55 dataset for subsequent interannual runs.

Kial’s email 2018-03-05:

-1st of January is in the peak of the northern winter and southern summer, meaning the variability in forcing fields (ie. weather) is quite high. This is a problem for surface buoyancy fluxes in the north Atlantic and Labrador & Nordic Sea regions, where NADW formation is notoriously sensitive to changes in surface forcing. The day of the year with lowest variability (least weather) is going to be closer to the equinoxes, and in JRA55 DO it turns out to be 1 May.

-The three candidate years have been selected as the 12-month periods with climate indices closest to neutral. The climate indices of interest are the SOI, SAM and NAO. Removing the criteria that a 12-month period follows the calendar year allows us to find “years” that are closer to climatologically neutral.

-Having the jump at 1 May allows us to run the model harder. The model tends to fall over at 1 Jan if the jump is there, meaning we have to back off the timestep and nurse it through. Having the jump at 1 May does not require any such nursing. Currently we are running the ACCESS-OM2 1° with 5400 sec timesteps from initialization and getting through 90 years per day.

### 3.5.2 CORE-NYF

### 3.5.3 Restoring

sea surface salinity restoring: salt.sfc.restore.nc from World Ocean Atlas 2013 v2 <https://www.nodc.noaa.gov/OC5/woa13/>; timescale set by salt.restore.tscale (we use 10 days) but what really matters is piston velocity 15m/300day ie 0.05m/day is GFDL’s standard piston velocity (Griffies, 12 April 2018)

with 1.1m top cell and 10 days, we have 0.11 m/day ie restoring twice as strongly as GFDL

see <https://github.com/OceansAus/access-om2/issues/52> and [http://www.earthsystemmodeling.org/esmf\\_releases/last\\_built/ESMF\\_refdoc/node3.html#SECTION03020000000000000000](http://www.earthsystemmodeling.org/esmf_releases/last_built/ESMF_refdoc/node3.html#SECTION03020000000000000000)

2nd order conservative interpolation: [Kritsikis et al. \(2017\)](#)

### 3.5.4 Bulk formulas used

- relative or absolute wind? see [Wu et al. \(2017\)](#) and [https://arccss.slack.com/archives/C6PP0GU9Y/p1511825314000106?thread\\_ts=1511802000.000465&cid=C6PP0GU9Y](https://arccss.slack.com/archives/C6PP0GU9Y/p1511825314000106?thread_ts=1511802000.000465&cid=C6PP0GU9Y) and <https://jra55-do.slack.com/archives/C7LEZT4KY/p1511963905000047> - we are using relative wind - but where is this set?

### 3.5.5 YATM / MATM

MATM parameters for the three model resolutions are tabulated in Appendix [A.3](#).

## 3.6 Initial conditions and spinup

Initial condition is from World Ocean Atlas 2013 v2 <https://www.nodc.noaa.gov/OC5/woa13/>.

What's the sea ice initial condition? 3m at pole, dropping off with latitude equatorward?? - Siobhan - parameter ice.ic = 'default' 'default' = latitude and sst dependent [https://github.com/OceansAus/cice5/blob/5583ce54fd8822c1b8aef0549090167ca5f36d10/source/ice\\_init.F90#L23](https://github.com/OceansAus/cice5/blob/5583ce54fd8822c1b8aef0549090167ca5f36d10/source/ice_init.F90#L23) sets up ice where SST is cold, max 3m thick...? [https://github.com/OceansAus/cice5/blob/5583ce54fd8822c1b8aef0549090167ca5f36d10/source/ice\\_init.F90#L1538](https://github.com/OceansAus/cice5/blob/5583ce54fd8822c1b8aef0549090167ca5f36d10/source/ice_init.F90#L1538)

### 3.6.1 Online runoff remapping via kdtree

## 3.7 Model computational details and performance

[Craig et al. \(2014\)](#)?

cf. MOM-SIS-01: 50–60kSU/day? - check with Andy

1/10°: 1200 PUs for CICE + 4358 PUs for MOM + 1 for MATM **TODO: update**

**TODO: cf. Matt Chamberlain's 2016 talk: global MOM-SIS at 1/10° and 50 levels, 960 CPUs (50x23 layout, 200 masked), dt=720s, month ~100min: [http://cosima.org.au/wp-content/uploads/2016/06/ofam\\_global.mac\\_.pdf](http://cosima.org.au/wp-content/uploads/2016/06/ofam_global.mac_.pdf) – this is as fast as ACCESS-OM2-01 but about 6x cheaper!**

## 3.8 Comparison with similar models

Namelists of MOM-based models are compared in Appendix [C](#).

### 3.8.1 GFDL CM2, CM2.5, CM2.6

cf. CM2-1deg CM2.5 CM2.6 (they were MOM v5) and discuss resolving eddies: [Griffies et al. \(2015\)](#) [Delworth et al. \(2012\)](#) [Dunne et al. \(2012\)](#) [Griffies \(2015\)](#)

cf. CORE ([Griffies et al., 2009](#)), CORE-II ([Danabasoglu et al., 2014](#))

minimum depth = 40m ?

### 3.8.2 ACCESS, ACCESS-CM2, ACCESS-ESM

cf. ACCESS [Bi et al. \(2013a,b\)](#); [Dix et al. \(2013\)](#)

[Bi et al. \(2013b\)](#)

cf. ACCESS-CM2 [Bi et al. \(2016\)](#), <http://cosima.org.au/wp-content/uploads/2016/06/BI-COSIMA-Hobart-20160526.ppt.pdf> - Uses same MOM, CICE and OASIS versions as ACCESS-CM2

cf. ACCESS-ESM [https://www.google.com.au/url?sa=t&rct=j&q=&esrc=s&source=web&cd=2&ved=0ahUKEwjvjsmH0rjZAhWEnpQKHb7VC-EQFgg0MAE&url=https%3A%2F%2Faccessdev.nci.org.au%2Ftrac%2Fraw-attachment%2Fwiki%2FScienceDay%2Fziehn\\_access\\_esm1.pdf&usg=AOvVaw1bYwLzey6vpy7g6v7W0aF0](https://www.google.com.au/url?sa=t&rct=j&q=&esrc=s&source=web&cd=2&ved=0ahUKEwjvjsmH0rjZAhWEnpQKHb7VC-EQFgg0MAE&url=https%3A%2F%2Faccessdev.nci.org.au%2Ftrac%2Fraw-attachment%2Fwiki%2FScienceDay%2Fziehn_access_esm1.pdf&usg=AOvVaw1bYwLzey6vpy7g6v7W0aF0)

**Table 3:** ACCESS-OM2 updates and extends ACCESS-OM and OFAM3

	ACCESS-OM	OFAM3	ACCESS-OM2
Ocean	MOM 4.1	MOM 4.1	MOM 5.1
Sea ice	CICE 4.1	—	CICE 5.1
Coupler	OASIS 3.25	—	OASIS 3-MCT
Grid	global tripolar, $z^*$	75°S–75°N only, $z^*$	global tripolar, $z^*$
Resolution	1°, 360×300×50	0.1°, 3600×1500×51, $\Delta z=5-1000\text{m}$	1°, 360×300× (50, 75 or 100 levels) or 0.25°, 1440×1080×50, $\Delta z = 10.1-210\text{m}$ or 0.1°, 3600×2700×75, $\Delta z=1.1-198\text{m}$

### 3.8.3 OFAM3

cf. OFAM3 namelists - see Matt Chamberlain's email 28 May 2018 [TODO: fix nmltab bug - emails with Marshall in May](#)

cf. oceanMAPS3.0 [http://cosima.org.au/wp-content/uploads/2016/06/Brassington\\_Ocean\\_modelling\\_and\\_forecasting\\_v3.pptx.pdf](http://cosima.org.au/wp-content/uploads/2016/06/Brassington_Ocean_modelling_and_forecasting_v3.pptx.pdf)

The vertical resolution has also been improved relative to OFAM3 (Oke et al., 2013) at nearly all depths, particularly at the surface and in the deep ocean, with 75 levels ranging from 1.1m thick at the surface to 198m thick at 5808m (compared to 51 levels ranging from 5m to 1000m thick currently in OFAM3/Bluelink). Of particular relevance for coastal studies is the improved vertical resolution in the upper ocean, with 31 levels in the top 200m and a minimum water depth of 10m (rather than 24 levels and a minimum depth of 15m for OFAM3), providing better resolution of shelf processes and a closer match to coastlines.

### 3.8.4 MOM-SIS-01

cf. MOM-SIS-01 Spence et al. (2017) - forced by 2° CORE NYF - 75 levels; ACCESS-OM2-01 has newer bathy, CICE, JRA55-do, and probably different vertical grid

### 3.8.5 UKMO GO6, GO7

cf UKMO GO6, GO7 Storkey et al. (2018) - based on NEMO.

GO7 has cavities under the ice shelves, whereas GO6 is similar to ACCESS-OM2-x in having no cavities and fresh water input at the ice shelf edges.

## 4 Model evaluation

use obs dataset and methods from CLIVAR Repository for Evaluating Ocean Simulations? <http://www.clivar.org/clivar-panels/omdp/reos>

cf Ocean Modelling CORE-II Special Issue (Virtual) <http://www.sciencedirect.com/science/journal/14635003/vsi/10PSR6J3BV4>

OMIP - Griffies et al. (2016) - does BOM/CSIRO already have code to do this for CMIP6? ask Marsland

cf Oke et al. (2013)

cf [http://www.cesm.ucar.edu/working\\_groups/Ocean/metrics.html](http://www.cesm.ucar.edu/working_groups/Ocean/metrics.html)?

cf esmvaltool <https://www.esmvaltool.org/>?

See Fanghua's observation comparison notebooks (should be on github) and also her presentation from 2018-01-25 and <https://github.com/FanghuaWu/cosima-cookbook/tree/master/notebooks>

maps of Smagorinsky biharmonic lateral viscosity? what is the viscous WBC width this implies?  
- note that lateral visc is increased near western boundary, even in 0.1° model: This is set by near-boundary\_scaling in 'MOM5/src/mom5/ocean\_param/lateral/ocean\_bihgen\_friction.F90'

#### 4.1 Barotropic streamfunction

late separation of Kuroshio - cf. [Colin de Verdière and Ollitrault \(2016\)](#) seems to be due to WSC anomaly in RYF8485 - see Kial's emails 16 May 2018 - see 10 year mean in Bluelink presentation Kiss-Bluelink-March-2018.pdf **TODO: see if problem also appears at lower resolution - see AK-AMOS-2018-figures**

#### 4.2 Surface current speed and variability

[Laurindo et al. \(2017\)](#) [Archer et al. \(2017a,b\)](#)

#### 4.3 Transports through key straits and boundary currents

use zigzag method in tripolar region? - see appendix C4 in [Griffies et al. \(2016\)](#)

**TODO: output vertical sections at high spatiotemporal resolution in diag\_table**

##### 4.3.1 ITF

##### 4.3.2 Drake Passage

##### 4.3.3 Agulhas

#### 4.4 Equatorial current velocity and temperature structure

cf. TOGA

#### 4.5 Overturning

[Farneti et al. \(2015\)](#)

#### 4.6 Meridional profiles of meridional heat transport

AMOC: do transect at 26.5N to cf RAPID array <http://www.rapid.ac.uk/rapidmoc/> [Smeed et al. \(2018\)](#)  
cf. [Newsom et al. \(2016\)](#)?

#### 4.7 Model bias assessments

Minimal model bias important for BOM for data assimilation in oceanMAPS, but is difficult to assess with repeat-year forcing as the mean of RYF is not climatology, so after many repeats of RYF the slowly-adjusting ocean features will match neither climatology nor the state in the repeat year, even if the model itself is unbiased.

cf BRAN

cf [Kerry et al. \(2016\)](#)

#### 4.8 Water mass properties and structure

mixed layer depth

##### 4.8.1 T/S diagrams

##### 4.8.2 Deep water formation rates, locations, properties

[Farneti et al. \(2015\)](#)

## 4.9 Heat conservation, bias and drift

cf FAFMIP? [Gregory et al. \(2016\)](#)

### 4.9.1 SST bias

### 4.9.2 lat/depth T sections and bias

### 4.9.3 Drift: depth/time T hovmollers

### 4.9.4 zonally averaged surface heat flux terms

## 4.10 Salt conservation, bias and drift

cf FAFMIP? [Gregory et al. \(2016\)](#)

### 4.10.1 SSS bias

### 4.10.2 lat/depth S sections and bias

### 4.10.3 Drift: depth/time S hovmollers

### 4.10.4 zonally averaged surface salt/freshwater flux terms

## 4.11 Variability

[Danabasoglu et al. \(2016\)](#)

### 4.11.1 Western boundary current variability

### 4.11.2 EKE spatial distribution and wavenumber spectrum

also check EKE spectrum to see if it follows the expected slope - eg [Capet et al. \(2008\)](#) cf. spectrum obs: [Xu and Fu \(2011\)](#)

## 4.12 Sea level

[Griffies et al. \(2014\)](#)

## 4.13 Sea ice

Reanalyses for possible comparison with model (from Helen Beggs' email 21 Mar 2018):

- Reanalyses of sea ice observations: The OSI-SAF reanalysis is available in 10 km resolution from: <http://osisaf.met.no/p/ice/index.html#conc-reproc> It covers the period from 1978 to 2009 with consistent algorithm processing. PUM and validation reports are available at the website as well. OSI-SAF Daily sea ice concentration analyses are being ingested into the new Decadal OFAM Climate Model by Sakov and Sandery.
- <http://osisaf.met.no>: ice concentration, edge, drift and emissivity on both hemispheres, as well as climate consistent time series
- Bremen/Hamburg University and their AMSR2 based products
- NCEP (Bob Grumbine), <http://polar.ncep.noaa.gov/seaice/> - BoM uses NCEP 1/12° Daily Global Sea Ice Analyses as operational inputs into their SST analyses, used as the boundary condition to the NWP models

<http://psc.apl.uw.edu/research/projects/arctic-sea-ice-volume-anomaly/>

thickness: [http://psc.apl.uw.edu/sea\\_ice\\_cdr/](http://psc.apl.uw.edu/sea_ice_cdr/)

see Ice.Validation.ACCESS-OM2-01.ipynb <https://github.com/aekiss/cosima-cookbook/blob/master/notebooks/Ice.Validation.ACCESS-OM2-01.ipynb>

see SIMIP [Notz et al. \(2016\)](#)

see [Toyota and Kimura \(2018\)](#)

and check convergence [Bouillon et al. \(2013\)](#); [Kimmritz et al. \(2015\)](#); [Lemieux and Tremblay \(2009\)](#);

[Losch and Danilov \(2012\)](#)

[Wang et al. \(2016b\)](#)

[Downes et al. \(2015\)](#)

cf [Heil et al. \(2011\)](#)

#### **4.13.1 Seasonal cycle of extent, coverage and thickness distribution**

#### **4.13.2 Age**

#### **4.13.3 Formation rate**

ice production rate in coastal polynyas ([Nihashi and Ohshima, 2015](#); [Ohshima et al., 2016](#); [Tamura and Ohshima, 2011](#); [Tamura et al., 2016, 2008](#)) - see Adele's email 9 Mar 2018 - includes a script and netcdf version. Looks like you can download the data set here: <http://www.lowtem.hokudai.ac.jp/wwwod/polar-seaflux/> what diagnostics give us production in CICE? f\_congel gives basal growth – not relevant? meltb, meltl, melts, meltt? frazil?

#### **4.13.4 Drift**

#### **4.13.5 Polynyas**

[Uotila et al. \(2013\)](#) [Girard et al. \(2009\)](#) [Kwok et al. \(2008\)](#)

### **4.14 Particularly important regions**

#### **4.14.1 ACC**

transport

EKE [Farneti et al. \(2015\)](#)

#### **4.14.2 North Atlantic**

North Atlantic mean state [Danabasoglu et al. \(2014\)](#) and variability [Danabasoglu et al. \(2016\)](#)

#### **4.14.3 Arctic Ocean / Greenland-Iceland-Norway (GIN) Seas**

mixed layer depth

water properties

bottom water formation

bottom water transport over sills

[Wang et al. \(2016c\)](#) [Ilicak et al. \(2016\)](#)

#### **4.14.4 Pacific**

[Tseng et al. \(2016\)](#)

#### 4.14.5 ITF

transports through straits - cf INSTANT array obs and Hautala et al. (2001); Sprintall et al. (2009)

Marsland 12 Apr 2018: ACCESS (1°) used Rayleigh drag to shift transport from westernmost to easternmost strait to match obs. Also cf. Perth-Jakarta line (XBT?)

#### 4.14.6 Agulhas

transport, structure, variability

## A Auto-generated namelists

These are auto-generated by make\_nml.tables.py which uses nmltab (<https://github.com/aekiss/nmltab>). Variables are weblinks to source code searches. Variables that differ between the models are highlighted.

**FIXME: these namelists are out of date**

**TODO: generate complete tables that include the default values of parameters not specified in namelists**
